

S3hpc

Nuclear emergency exercise simulation software for personal handheld computers

The S3hpc software is an add-on to our S3-Exercise software. It allows players to use a handheld personal computer (HPC) during exercises rather than a laptop, thereby increasing the realism of the simulation.

How it works

Once S3hpc is installed, an S3-Exercise scenario can be downloaded to the HPC with the simple click of a button. Simulated instrument panels can then display readings that change as a function of time and location. Selected screenshots are shown below.

Features

- Displays readings from 4 different types of instrument i.e. dosimeters, survey meters, air samplers and GPS units
- Emits an audible alarm when limits are reached
- Shows whether the handheld GPS is receiving reliable data using a colour indicator
- Displays different skins that look like actual instrument display windows

System requirements

- HPC running Windows CE e.g. Compaq iPAQ (Note: S3hpc software for Palm is currently being developed)
- GPS that is compatible with the HPC
