

SMS Processes, Tools and Artefacts

To get the work done, you need the right processes and tools.

What is it?

SMS is, in origin, an academic concept that only becomes real through the execution of its supporting processes. These processes become reality through a series of low level documents, programs and objects that will support your effort in implementing and managing SMS.

Why do it?

SMS “lives” through the specific actions practiced daily in an integrated manner with our regular business activities. These actions, executed through a set of templates, programs and objects, will ensure a rapid transition and smooth the learning curve for the “uninitiated”.

Why chose ISR?

ISR can support your organization in developing the processes that will support your SMS in a way that is tailored to your operations and your way of doing business. Our experience and knowledge of SMS best practices provides us with a broad knowledge of what is being done “out there” and can help you develop what best suits your needs.

We have developed a proprietary methodology that will help guide your organization through all the processes needed to support an effective SMS and identify its interdependencies.

In addition, ISR can produce a series of elements that can jump-start your SMS. Examples include:

Document and record management protocol
Corrective Action Plan form
Standard Operating Procedures template
Report form
Risk Management log template
Hazard identification tools & template
Training program
SMS Awareness Program and communication campaign
SMS Assessment Protocol
Organizational List of objectives
Organizational List of Performance Indicators
